

To create a webapplication it

DAV

% Pólo

The configuration does not differ too much from the first example. Just replace `: <firstproject>` with `: pages`, because our module name is now `pages.so` instead of `<firstproject>.so`.

9 all `-make` to compile it and as usual run the application with `-tntnet (c tntnet.conf..`

! block ... contains a subcomponent call. In our simple case we have a normal `933(string(` constant here. It can be also a variable or a function call, which returns a `std::string`.
